Experience

AppsStoneLab Technologies

Software Engineer (SDE-1)

April 2026 – Present

Surat, India

BooksCloud / SplitShops — *Shopify book-dropshipping platform; 2.5M-book catalogue synced across ~650 merchant stores*

- Cut worst-case query latency from 400–800s to under 65s (typically under 10s) across a 35M-row store-product table, eliminating the timeouts that were stalling per-store catalogue syncs.
- Replaced per-item Shopify API calls with bulk mutations for location activation, delivery-profile assignment, and inventory updates, collapsing three fragile queue jobs into one batched flow and removing an entire class of ordering-related sync failures.
- Rebuilt Shopify sync status tracking so each operation became independently queryable and retryable, replacing an opaque status blob that made failed-product lookups slow and per-operation retries impossible.
- Tuned the heaviest read paths on an overloaded PlanetScale (MySQL) instance — recursive category-tree traversal, published-product counts, and post-sync read-backs — brought hand-applied production indexes under version control, and split a monolithic hourly counting job into per-organisation jobs so one slow tenant no longer delayed the rest.

OneTapConnect — *multi-tenant digital business card platform*

- Owned the migration that moved licensing from users to microsites, allowing one person to hold multiple digital cards and customers to be billed per card rather than per seat; authored the phased plan that separated licensing from analytics and permission semantics so the change could not silently corrupt reporting.
- Built card reassignment so a microsite transfers between employees without breaking its published URL, losing website content, or discarding edit history — with guards for archived cards, unaccepted invitations, and self-transfer.
- Kept every public profile URL working through the migration by resolving new slugs against company, legacy-user, and legacy-company redirects, and auto-creating a redirect whenever a slug changed.
- Delivered user and microsite administration across the customer and admin applications — invitations, activation with redirect handling, CSV import, and role-based module access — spanning backend APIs, Next.js frontend, and mobile routes.
- Diagnosed and fixed a production Stripe billing defect, shipping the fix alongside a backfill script validated on staging; moved analytics attribution to microsite level and added scheduled monthly reporting for managers and admins.

AppsStoneLab Technologies

NodeJS Developer Intern

January 2026 – April 2026

Surat, India

- Separated user identity from card content on OneTapConnect, moving profile content into a dedicated microsites table and re-pointing websites, smart accessories, redirects, and analytics at it — the change that made multiple cards per user possible.
- Decoupled account activation from ChargeBee subscriptions so demo and enterprise clients could be onboarded and configured before any billing relationship existed, with a reversible flow to attach a subscription later.
- Delivered the Location module end-to-end, letting customers group cards by office with standardised addresses, inherited contact details, and bulk reassignment guarded against orphaning cards.

Projects

E-Commerce Backend API | *AdonisJS, TypeScript, Stripe, MySQL, Redis*

- Built a production-grade e-commerce REST API from scratch covering catalogue, cart, orders, reviews, and payments, with full automated regression coverage across customer, seller, admin, and webhook surfaces.
- Made payment handling safe against duplicate and out-of-order Stripe webhooks using event deduplication and transactional order creation, so retries could never double-charge or double-decrement stock; refunds restore inventory atomically.
- Gated seller capabilities behind active-subscription middleware with per-tier limits, over multi-role auth with signed-URL email verification and rate-limited login.

Technical Skills

Languages: TypeScript, JavaScript, SQL, Python

Backend: Node.js, AdonisJS, REST API design, Lucid ORM, Bull Queue, cron scheduling

Databases: MySQL, PlanetScale, Redis — query optimisation, indexing, schema migration

Frontend: Next.js, React

Payments & Billing: Stripe, ChargeBee

Integrations: Shopify Admin API (GraphQL, Bulk Operations), HubSpot, AWS S3

Tools & Testing: Docker, Git, GitHub, Japa

Auth & Security: JWT, VineJS, Role-Based Access Control, Rate Limiting

Education

Sarvajnik College of Engineering and Technology

B.Tech in Computer Engineering — CGPA: 9.2/10

2022 – 2026

Surat, India
